

Public consultation on the renewable energy framework for the decade ahead

Fields marked with * are mandatory.

Introduction

An increased uptake of renewable energy sources (RES) will contribute to energy security, energy affordability, Europe's competitiveness, and the achievement of the 2040 EU climate target [1]. Whilst the share of renewables in the EU energy mix has doubled in 13 years reaching 25.2% renewables share in 2024, deployment rates need to accelerate substantially. Electricity is leading the way with a 47.5% renewables share. Heating and cooling (26.7%) and transport (11.2%) are lagging behind.

As announced in [the Commission Work Programme 2026](#), the European Commission plans to keep Europe on track to meet its climate goals and put forward an enabling framework for the decade ahead, securing Europe's competitiveness and sustainability, including setting up the renewable energy framework and the phase-out of fossil fuel subsidies. The overarching objectives of the updated renewable energy framework for the decade ahead will be to strengthen the EU's competitiveness and resilience by securing reliable and affordable homegrown energy for European citizens, businesses and industry, and to ensure that renewables contribute to the achievement of the 2040 EU climate target in a cost-effective and environmentally sustainable way. In this context, the strategic objectives would be to accelerate investments into homegrown renewables in a cost-effective manner; to strengthen the enabling framework to help integrate renewable power into the electricity sector; to improve energy system integration and facilitate electrification across demand sectors; to incentivise the uptake of renewable fuels and technologies that are not yet cost-competitive, while preserving competitiveness of the economy, and to stimulate innovation; to improve the bioenergy framework; to ensure predictability and certainty of the energy transition pathway; and to streamline the overall framework and regulatory and administrative procedures.

The post-2030 renewables framework will be developed in coherence with the revision of [the Governance Regulation](#) (for which [a call for evidence and public consultation](#) was open until 19 March 2026), the 2040 Climate Law, the energy efficiency framework, the updated EU Emissions Trading System, as well as other legislation and initiatives with impacts on renewables. It will succeed the existing Renewable Energy Directive (RED), as well as build on the Clean Industrial Deal, the Affordable Energy Action Plan, the European Grids Package, the Strategic Roadmap on Digitalisation and AI in the Energy Sector, the Electrification Action Plan and the Heating and Cooling Strategy.

In this context, the Commission is launching a public consultation to gather views from all interested parties, focusing on:

1. General questions
2. Enabling framework
3. Integration of renewables into the electricity system
4. Energy system integration across energy carriers, infrastructure and consumption sectors
5. Innovative and emerging technologies and forms of renewable energy deployment
6. Bioenergy sustainability
7. Union renewable energy financing mechanism

The results of this consultation will feed into the preparation of the updated renewable energy framework.

You can save your replies as a draft and finish them later. You can choose to only answer the sections and specific questions which are relevant to you.

[1] On 2 July 2025, the European Commission proposed an amendment to the European Climate Law to set an intermediate EU target for reducing greenhouse gas emissions by 90% by 2040 compared to 1990 levels. In December 2025, the co-legislators reached a provisional agreement on the amendment supporting a 90% emission reduction target, allowing for international credits to contribute to this target with up to 5%.

UPEI supports an ambitious post-2030 renewable energy framework that Provides a coherent, stable, and forward-looking legislative framework. Amends current legislation only to the extent that it is necessary to implement the revised European Climate Law’s intermediary target of 90% by 2040. Promotes e an honest and full implementation of the technology neutrality principle, notably as regards infrastructure planning, methodological choices (e.g. primary energy factors), and regulatory design. Combines policy ambition and practical achievability, considering the availability of renewable fuels, infrastructure constrains, technology maturity and realistic scaling times. Considers flexibility mechanisms to address temporary imbalances between targets and market realities. Builds a diversified and resilient energy system that addresses the short, medium, and long-term geopolitical dimension by strengthening the role of renewable fuels for resilience and supply security.

Q2: In the context of the revision of the Governance Regulation, the Commission has [asked for evidence](#) in the period between 18 December 2025 and 19 March 2026 on the preferred target architecture for the energy post-2030 framework.

In case you have not participated in the consultation on the Governance Regulation by the 19 March 2026 deadline, the following question on the revision of the Governance Regulation is replicated here:

Currently, the EU has a 2030 renewable energy target with voluntary national

contributions. In your view, what should be the design **to support the necessary renewables uptake** to meet the EU's 2040 climate objectives?

Use drag&drop or the up/down buttons to change the order or accept the initial order.

- ⋮ **Option 1:** Continue with the current structure of binding EU targets for renewables and energy efficiency, supported by national contributions guided by formulas (Based on the formulas for Member States contributions on renewable energy and energy efficiency under the current governance framework)
- ⋮ **Option 2:** Keep a similar structure with binding EU targets as in option 1 while allowing for flexibilities that reflect Member States' specificities
- ⋮ **Option 3:** Define a single, overarching clean energy target for the EU, with embedded minimum thresholds for key energy parameters (e.g. renewable energy)
- ⋮ **Option 4:** Define a single, overarching electrification target for the EU, with embedded minimum thresholds for key parameters (e.g. renewable energy, energy efficiency)
- ⋮ **Option 5:** Option 1, 2, 3 or 4 complemented/combined with monitoring KPIs for key energy system components (e.g. electrification, waste heat reduction or re-use), while ensuring transparency and comparability

We kindly ask stakeholders should you have something to add or specify regarding the post-2030 target architecture for renewables specifically, please do so here:

1000 character(s) maximum

The post-2030 architecture should be based on

- An evaluation of the RED III implementation.
- The integration of the security of energy security element.
- The acceptance that biomass scarcity is not an issue.
- The promotion of advanced biofuels and RFNBOs as viable solutions at the same level as electrification.
- A strengthened focus on harmonised EU-wide standards for certification, traceability, and verification.
- The prevention of double counting and overlapping support schemes across Member States, to further support a level playing field and safeguard market integrity.
- The harmonisation of fuel standards and blending limits, setting up interoperability and user-friendly systems.
- The replacement of Annex IXA of the RED by a comprehensive definition of bio feedstocks in the Directive itself, allowing for more flexibility: no need to use Implementing Measures to amend the Annex, and better harmonisation between the Member States.

Part II: Enabling framework

Renewables self-consumption & renewable energy communities

Businesses and households can become “self-consumers” by producing and consuming some or all their own electricity. Local actors can also create “energy communities” that invest in renewable energy. Both are set to play a growing role in supporting market integration of variable renewable electricity and reducing consumers' energy bills.

Q3: How important are the following measures for ensuring the wider uptake of renewable energy self-consumption and energy communities?

Public acceptance of renewables

While the latest [Eurobarometer](#) shows overall strong support for renewables among Europeans, local opposition to certain projects persists, underscoring the importance of continued efforts on public acceptance and participation. Public acceptance can be promoted through direct and indirect participation of local communities in renewable energy projects. This includes financial participation and benefit-sharing, but also procedural participation in decision-making and awareness raising, and the inclusion of non-price criteria in renewable energy auctions, e.g. to promote environmental sustainability or social aspects. Relevant provisions exist under the RED, and further measures are included in the European Grids Package proposals.

Regional & cross-border cooperation

Regional and cross-border cooperation within the EU and with non-EU countries can reduce overall costs and ensure cost-efficient deployment of renewables. Under the RED, Member States have the possibility to enter into various regional and cross-border cooperation mechanisms to deploy renewables, but so far, their use has been very limited.

Financing & support schemes

Approximately €130 billion of investments in clean energy generation are estimated to be needed annually from 2031 – 2040, with renewables representing 80%. In addition, €90 billion of investments are needed annually in the power grid [2]. While the bulk of renewable energy is deployed today with state support, the energy transition should be increasingly based on private, market-driven investments. Public support, including State aid, can continue to play a role where market failures persist. To meet the considerable investment needs towards 2040, the enabling framework needs to mobilise private capital and better target public funding to leverage private investments and de-risk projects.

Clearly distinguish between RFNBOs and advanced biofuels, which require distinct kinds of support in terms of research, development, and production. In general, different technologies require different policy approaches and timelines: regulatory and incentive frameworks should promote their complementary roles and avoid creating unintended competition between them.

Part III: Integration of renewables into the electricity system

Renewable energy capacity is growing at a record pace in Europe. System limitations that hamper the integration of new capacities into the electricity system need to be addressed, including grid constraints, low electricity demand, and limited non-fossil energy system flexibility, which can be provided by storage technologies and demand response. Renewables also need to be located in areas where they can contribute most to system needs, including alleviating grid congestion. As part of the reform of the [Electricity Market Design](#) in 2024 and the [European Grids Package](#) in 2025, steps were taken to tackle such system constraints. Addressing current system limitations is important for improving the market conditions for renewable electricity, which are increasingly impacted by the reduction of the market revenues they can generate due to the rise in hours of low/negative electricity prices correlated with renewable production.

Renewable fuels can provide flexibility, seasonal storage, and support, notably for sectors that are difficult to electrify. The post-2030 framework should promote technology neutrality and energy system integration across electricity, transport, heating and industry. Market design should reward flexibility and system value while ensuring a level playing field for all renewable solutions. Faster permitting for generation and supporting infrastructure will also be critical.

Part IV: Energy system integration across energy carriers, infrastructure and consumption sectors

Energy system integration means creating stronger links between different types of energy carriers (such as electricity, liquid, gas and solid fuels, heat and cold), energy infrastructure and consumption/demand sectors. This integration supports the uptake of renewable energy and can help optimise the energy system. It includes a strong focus on electrification of final energy consumption, and for demand sectors that are difficult to electrify, focus on indirect electrification through the conversion of electricity into fuels, such as hydrogen, and other solutions.

Electrification of final energy consumption

Demand for renewable heating remains structurally underdeveloped in EU energy policy. While transport is supported by a binding supplier obligation, heating continues to rely on indicative targets and national implementation. This resulted in slower deployment of renewables in heating compared to other sectors, despite the scale of emissions it creates.

The lack of a demand-side mechanism is a key structural barrier. Without a clear and predictable signal, investment in renewable heating fuels remains constrained, limiting supply development and slowing cost reductions, despite the fact that solutions, including both renewable liquid fuels such as HVO and rLGs are readily deployable.

A renewable heat obligation provides a practical and scalable solution to address these challenges. It enables a gradual transition, allowing consumers to decarbonise over time while avoiding immediate, high upfront costs. A GHG intensity-based design is particularly suited to this objective.

Renewables in transport

Part VI: Bioenergy sustainability

Biomass sourcing sustainability

Bioenergy represents half of the EU's renewable energy mix and serves as an important dispatchable, storable, and mainly EU-sourced energy solution. However, specific criteria are required to ensure that the biomass used to produce energy is sustainably sourced, considering both the limited availability of traditional biomass and the untapped potential of most advanced and sustainable feedstocks. The decline in EU's carbon removal sink - as stated by the [EU Climate Action Progress Report 2025](#), should also be accounted for. The RED sets standards for sustainability and greenhouse gas emissions savings for biomass for bioenergy purposes and introduces the cascading principles [4]. However, the sustainability criteria do not apply to certain applications beyond bioenergy, such as the production of materials and chemicals. Additionally, sustainability criteria are inconsistently applied across member states, indicating a need for a more streamlined approach.

Q13: How important are the following measures for improving the sustainability of biomass sourcing?

Q14: What should be the scope of sustainability criteria for biomass sourcing?

Sustainability criteria should apply to biomass used for...

Maximum 1 selection(s)

- producing energy only, in line with today's framework
- certain other purposes beyond producing energy (please specify which other purpose(s) in comment below)
- all purposes, excluding food and feed production

Bioenergy use optimisation

Bioenergy is a versatile energy source, that can be used to produce energy across multiple end uses as well as to provide storage and enhance energy security. However, due to its limited availability, it should be used in an efficient way focusing on sectors where it has the highest economic and environmental added value, and primarily in applications that cannot be electrified. These considerations are not reflected in the current EU legislative framework. Implementing bioenergy optimisation strategies can provide benefits for the whole energy system, for instance by incentivising the shift towards more sustainable and heterogeneous biomass from different sources – such as certain forestry and agricultural residues - and by ensuring bioenergy facilities contribute to addressing the flexibility needs of the system.

Availability of biomass is not an issue.

Part VII: Union renewable energy financing mechanism

The Renewable Energy Financing Mechanism (RENEWFM) allows a cost-effective deployment of renewables by bringing together EU Member States that have low availability of domestic resources and others that have more favourable conditions for renewables deployment. A primary objective of the mechanism as established in the Governance Regulation is to contribute to renewables target achievement, helping to cover a potential gap towards the 2030 Union target for renewable energy (gap-filling function). A second objective of the mechanism as set out in the RED is to support renewable energy deployment across the Union by contributing to the enabling framework (enabling function). Under the enabling function, Union-wide auctions financed by EU funds may be considered. The mechanism kicked off in September 2023, and interest and participation of Member States is gradually increasing but remains limited.
